

### What transport service does an app need?

#### Data loss

- some apps (e.g., audio) can tolerate some loss
- other apps (e.g., file transfer, telnet) require 100% reliable data transfer

#### Timing

 some apps (e.g., Internet telephony, interactive games) require low delay to be "effective"

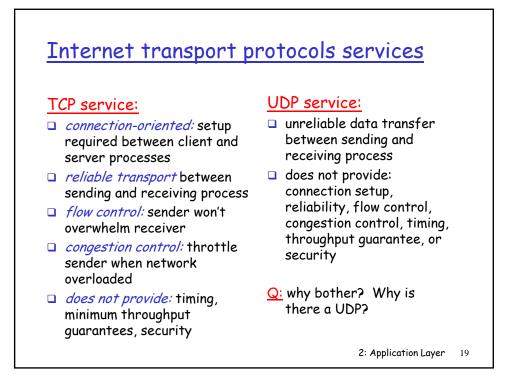

#### Throughput

- some apps (e.g., multimedia) require minimum amount of throughput to be "effective"
- other apps ("elastic apps") make use of whatever throughput they get

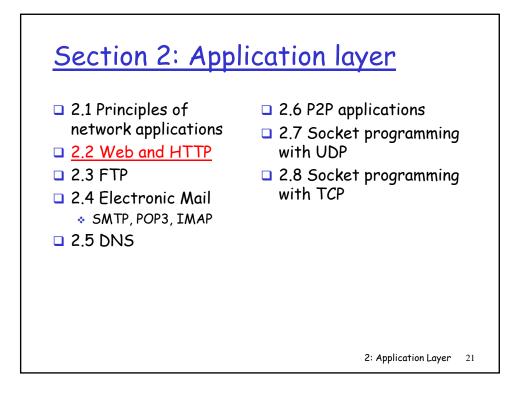

#### Security

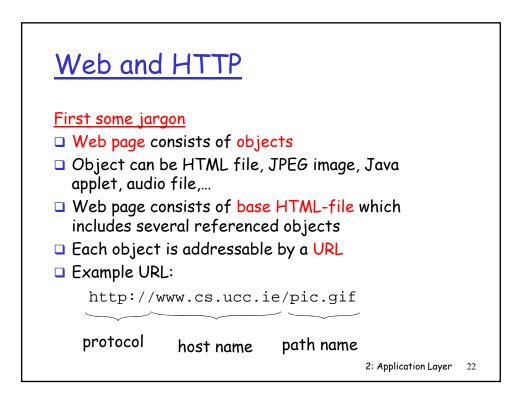

• Encryption, data integrity, ...

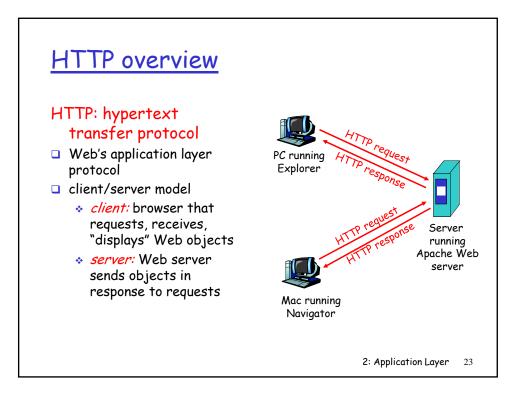

Application	Data loss	Throughput	Time Sensitive
file transfer	no loss	elastic	no
e-mail	no loss	elastic	no
Web documents	no loss	elastic	no
al-time audio/video	loss-tolerant	audio: 5kbps-1Mbps video:10kbps-5Mbps	yes, 100's mse
stored audio/video	loss-tolerant	same as above	yes, few secs
interactive games	loss-tolerant	few kbps up	yes, 100's mse
instant messaging	no loss	elastic	yes and no

	Application	Application layer protocol	Underlying transport protocol
	e-mail	SMTP [RFC 2821]	ТСР
emote terminal access Web		Telnet [RFC 854]	TCP
		HTTP [RFC 2616]	TCP
_	file transfer	FTP [RFC 959]	ТСР
streaming multimedia		HTTP (eg Youtube), RTP [RFC 1889]	TCP or UDP
In	ternet telephony	SIP, RTP, proprietary (e.g., Skype)	typically UDP

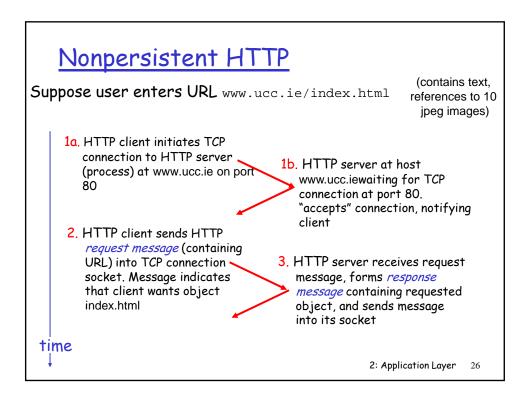

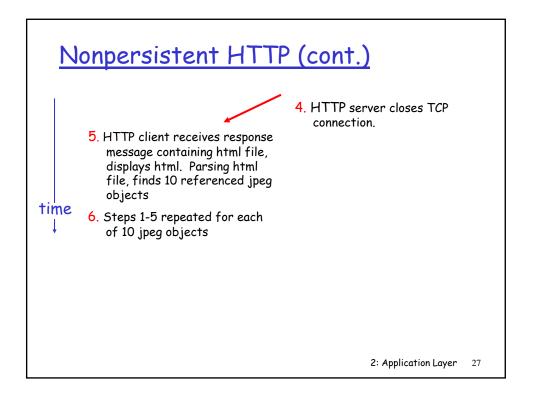

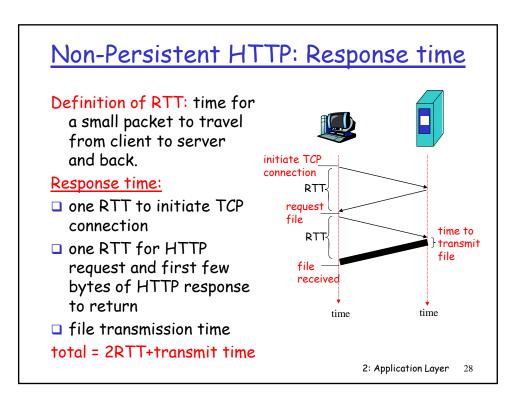

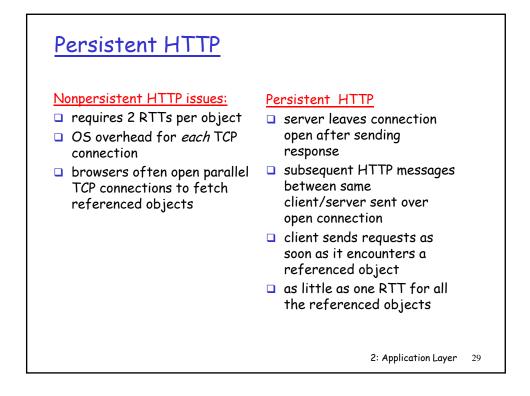

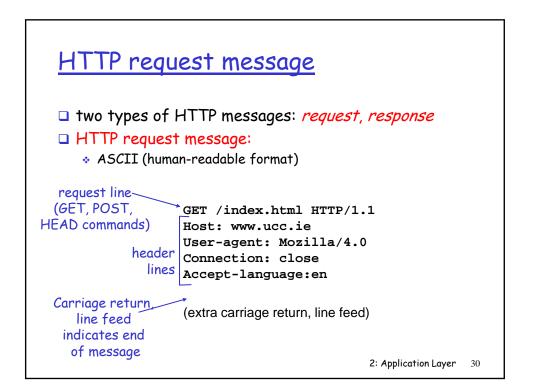

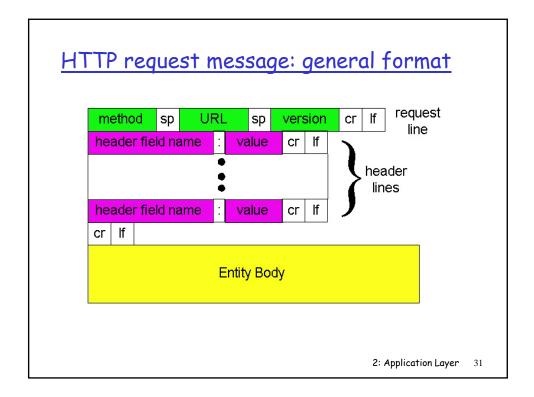

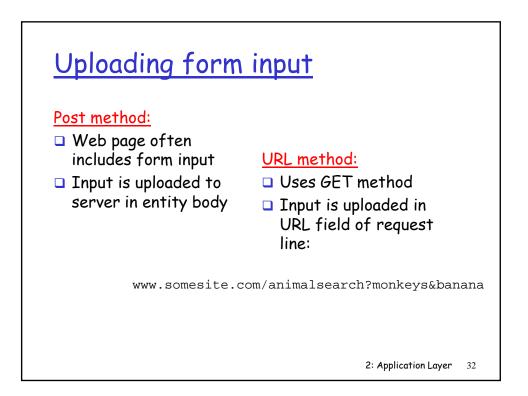

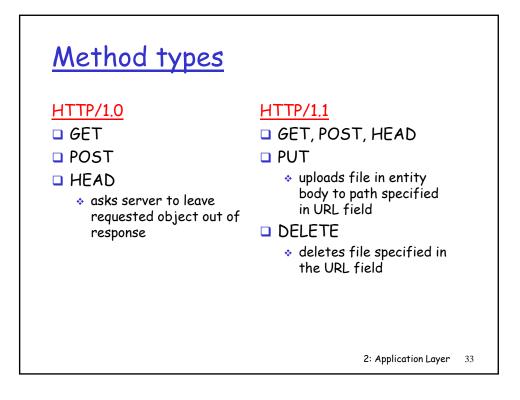

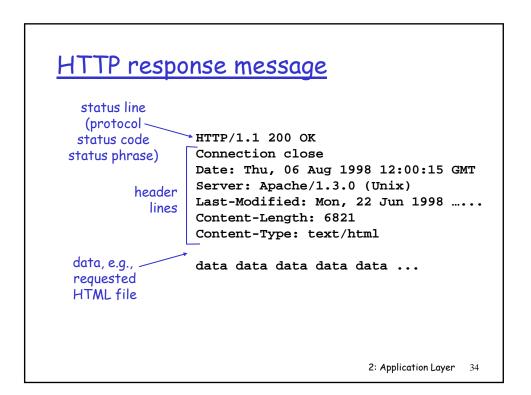

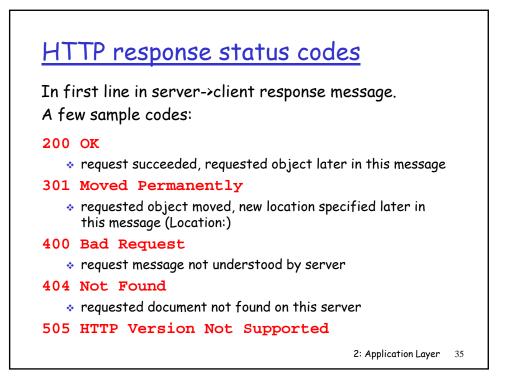

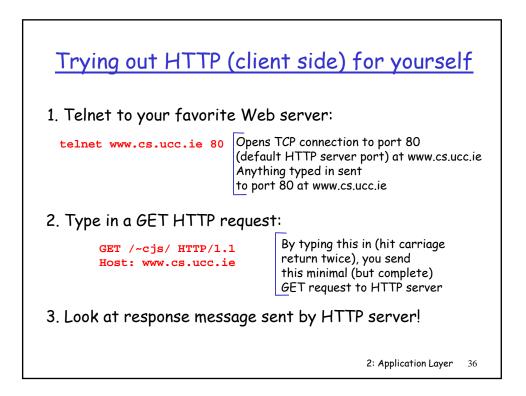

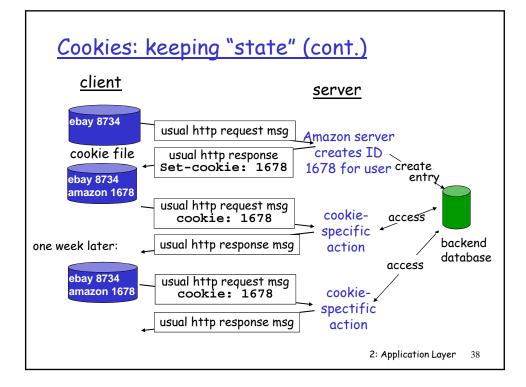

#### Many major Web sites use cookies

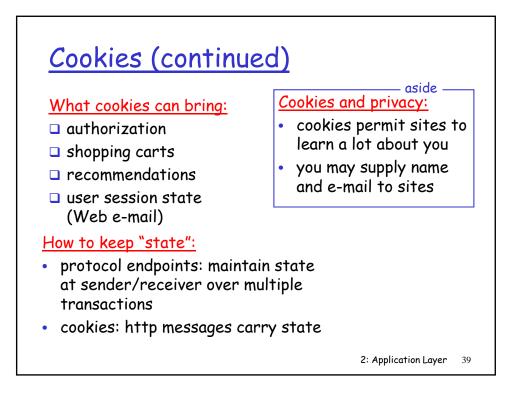

#### Four components:

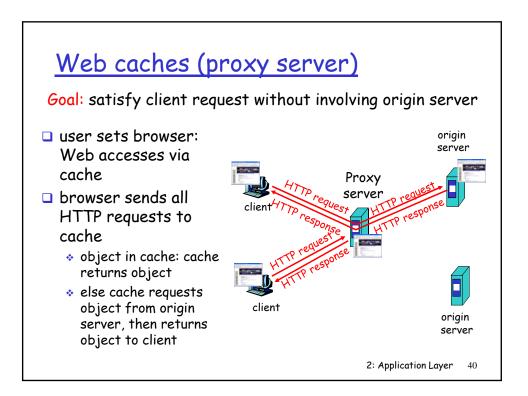

- 1) cookie header line of HTTP *response* message
- 2) cookie header line in HTTP *request* message
- cookie file kept on user's host, managed by user's browser
- 4) back-end database at Web site

#### Example:

- Susan always access
   Internet always from PC
- visits specific ecommerce site for first time
- when initial HTTP requests arrives at site, site creates:
  - unique ID
  - entry in backend database for ID

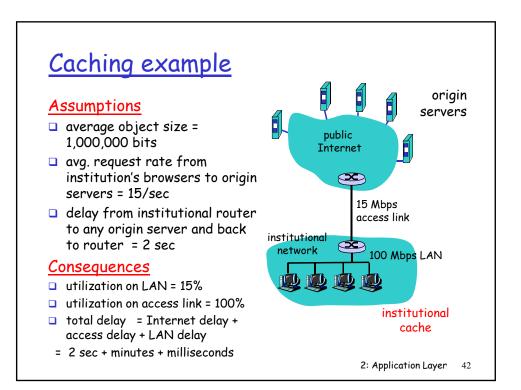

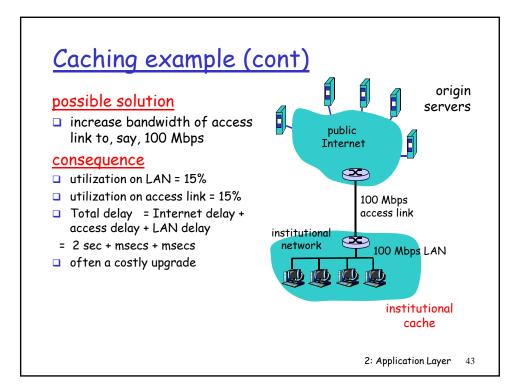

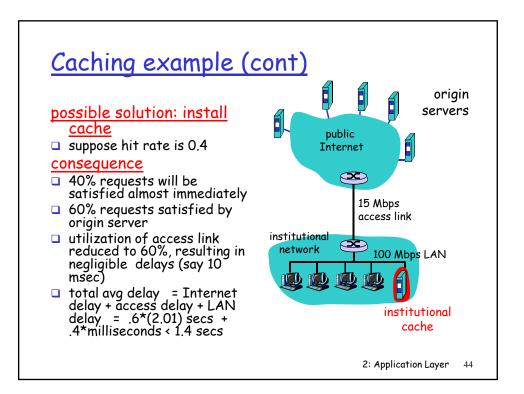

- cache acts as both client and server
- typically cache is installed by ISP (university, company, residential ISP)

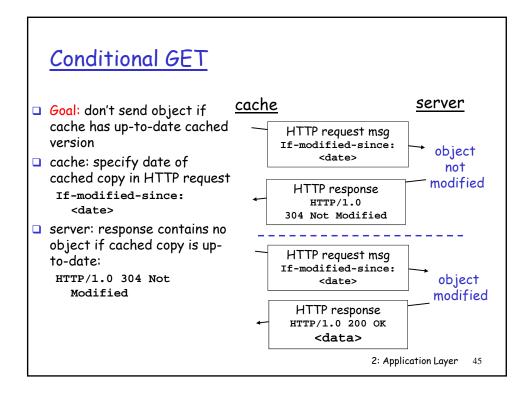

#### Why Web caching?

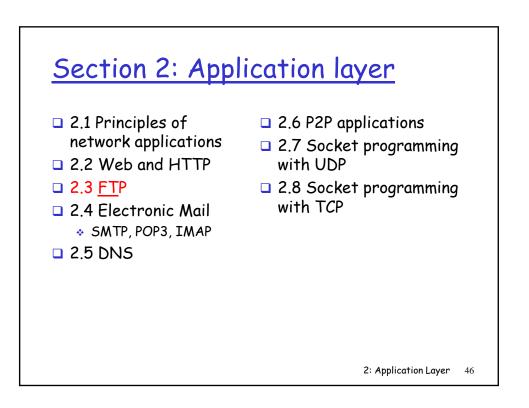

- reduce response time for client request
- reduce traffic on an institution's access link.
- Internet dense with caches: enables "poor" content providers to effectively deliver content (but so does P2P file sharing)

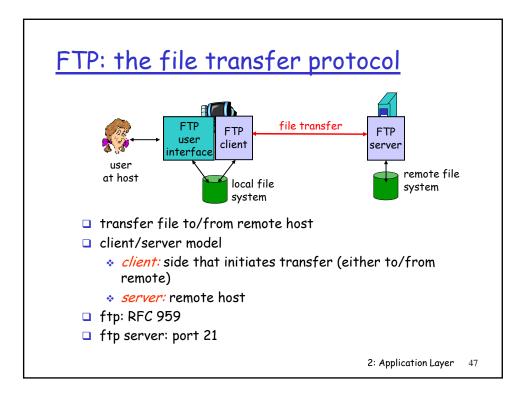

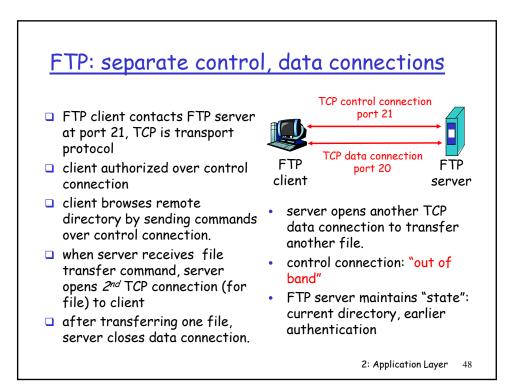

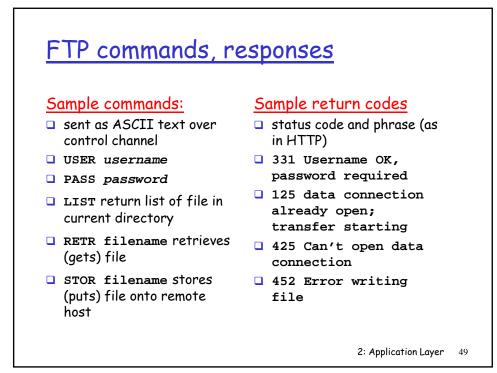

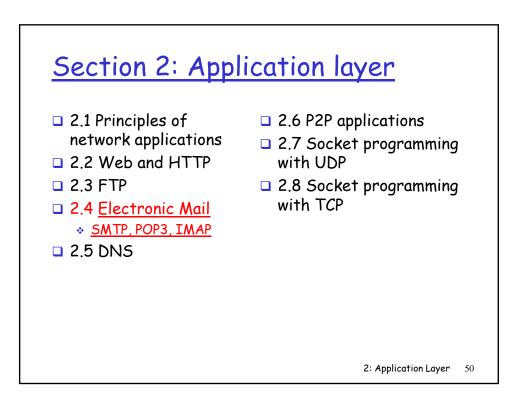

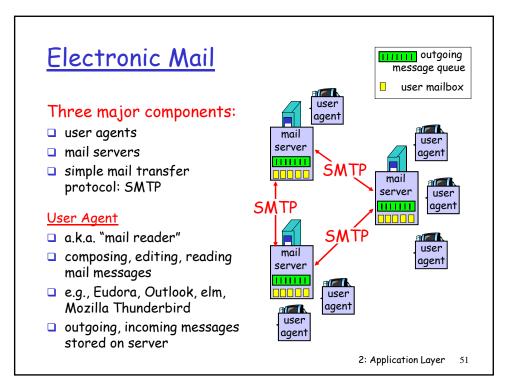

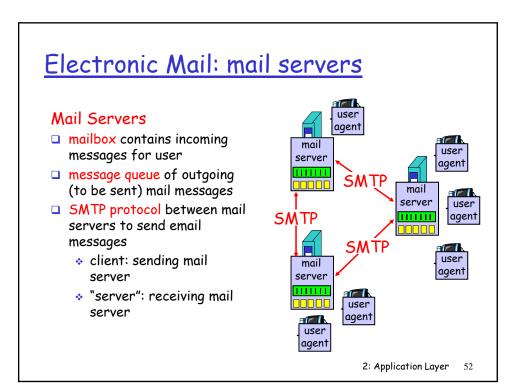

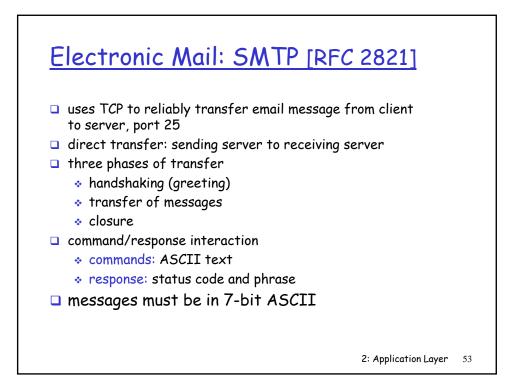

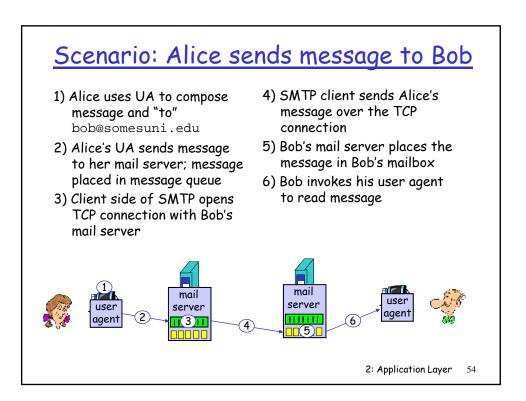

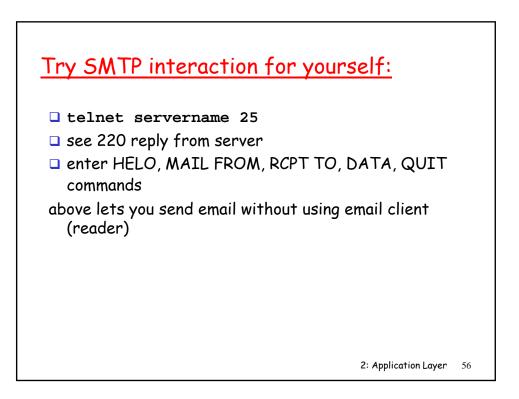

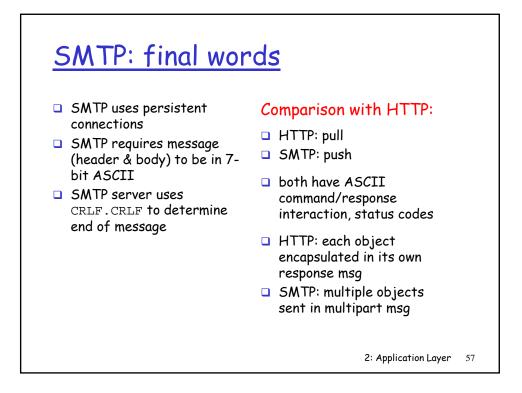

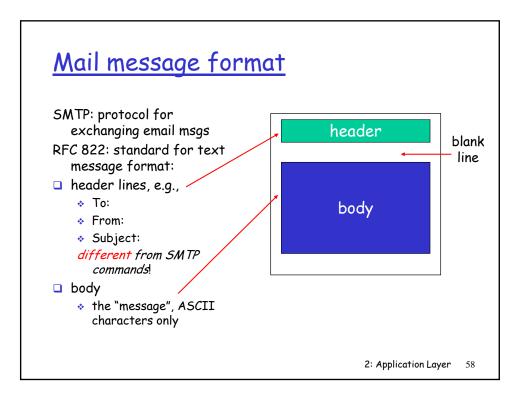

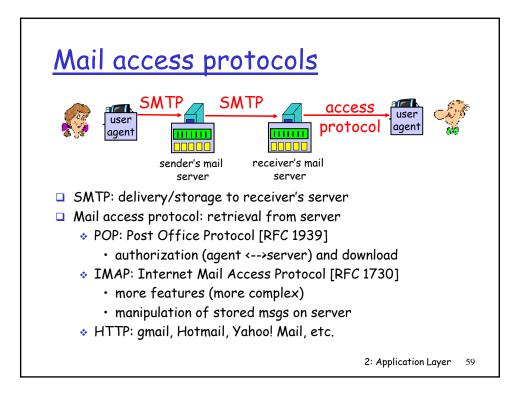

## Sample SMTP interaction

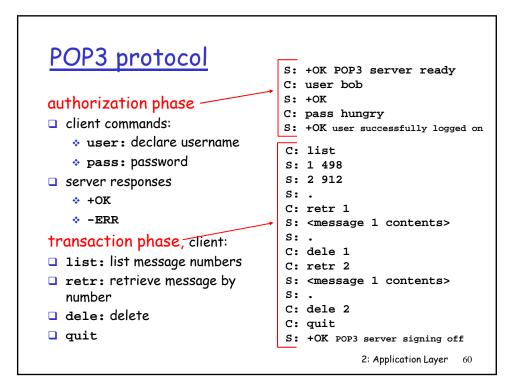

```
S: 220 hamburger.edu
C: HELO crepes.fr
S: 250 Hello crepes.fr, pleased to meet you
C: MAIL FROM: <alice@crepes.fr>
S: 250 alice@crepes.fr... Sender ok
C: RCPT TO: <bob@hamburger.edu>
S: 250 bob@hamburger.edu ... Recipient ok
C: DATA
S: 354 Enter mail, end with "." on a line by itself
C: Do you like ketchup?
C: How about pickles?
C: .
S: 250 Message accepted for delivery
C: QUIT
S: 221 hamburger.edu closing connection
                                      2: Application Layer 55
```

# POP3 (more) and IMAP

#### More about POP3

#### IMAP

- Previous example uses "download and delete" mode.
- Bob cannot re-read email if he changes client
- "Download-and-keep": copies of messages on different clients
- POP3 is stateless across sessions

- Keep all messages in one place: the server
- Allows user to organize messages in folders
- IMAP keeps user state across sessions:
  - names of folders and mappings between message IDs and folder name
