Q1 Stemming typically increases recall

A and reduces precision.

because more words map to a stem
making more words equivalent

Example WA WB WC → Stem W

Looking for either WA WB WC when

will get docs for WA WB WC will

get docs for all

Q1B Databases typically use boolean

retrieval and can occasionally

support soundex Their data is

structured ^{into rows and columns} and expert users

typically create queries which

involve the conjunction and disjunction

of columns:-

Information ^{retrieval} data consists of documents

with typically little structure

(can have headings and titles)

Queries are constructed so they satisfy

an INFO need. They are typically

consisting of words that the

doc should contain. good IR

systems rank data in order

of how likely it is to be matching

the information need

Zipf's Law $C_i = \frac{1}{i} (C_{i-1})$

i-th most common = $\frac{1}{10}$ inverse i

computer

$\frac{2}{6}$

$\frac{0}{4}$

$\frac{9}{2}$

Q1 d

$\Gamma_b \times \Gamma_b$

no

does not end in b

$\frac{64}{6}$

$\Gamma_b A \Gamma_b A$ would match

even though $\Gamma_b a \Gamma_b \boxed{a}$ not $\Gamma_b \times \Gamma_b$

Q2

$\frac{16}{20}$

A	Retrieved	Not Retrieved
1	Relevant	1 Not Relevant
2	Relevant	2 Relevant
3	Not Relevant	3 Not Relevant
4	Not Relevant	4 Not Relevant

$$\text{Precision} = \frac{\# \text{ relevant Items Retrieved}}{\# \text{ Retrieved Items}}$$

$$\text{Precision} = \frac{2}{4} = \frac{1}{2}$$

$$\text{Recall} = \frac{\# \text{ relevant Items Retrieved}}{\# \text{ Relevant Items}}$$

$$\text{Recall} = \frac{2}{3}$$

$\frac{4}{4}$

$$Q2B \quad F = \frac{1}{\alpha \left(\frac{1}{P}\right) + (1-\alpha) \left(\frac{1}{R}\right)}$$

FOR Precision to be twice as important as recall $\alpha = \frac{2}{3}$ ✓

$$F = \frac{1}{\frac{2}{3} \left(\frac{1}{\frac{1}{2}}\right) + \frac{1}{3} \left(\frac{1}{\frac{2}{3}}\right)} \Rightarrow \frac{4}{3} + \frac{1}{2} = \frac{6}{11}$$

$\frac{4}{4}$

Q2

C

$$K = \frac{P(A) - P(E)}{1 - P(E)}$$

	Judge b. yes	Judge b. no	Total
Judge a Yes	2	1	3
Judge a NO	0	1	1
Total	2	2	4

$$\frac{3}{4}$$

$$\frac{3}{4}$$

$$P(A) = \frac{2 + 1}{4} = \frac{3}{4}$$

$$P(E) = \frac{2 + 2 + 3 + 1}{4 + 4 + 4 + 4} = \frac{1}{2}$$

$$\frac{0}{2}$$

values $P(\text{ruler})$, $P(\text{non-ruler})$

$$\frac{0}{2}$$

$$K = \frac{\frac{3}{4} - \frac{1}{2}}{1 - \frac{1}{2}} = \frac{1}{2}$$

$$\frac{1}{1}$$

NO there is not

A good agreement requires K to be between $\frac{2}{3}$ and 1. $\frac{1}{2} < \frac{2}{3}$

Q3

A

$\frac{10}{10}$

Document 1 Precision is very very high
